

Basic Networking Concepts and Tools

Tony Espinoza

am.espinoza@utexas.edu

Networks

- ▶ What are some networks you are familiar with?
 - ▶ Local Area Network, home network.
 - ▶ Office network.
 - ▶ University network.

Networks

- ▶ Let's go into detail with a common network everyone uses every day.
- ▶ The Internet.
- ▶ What is the Internet?
 - ▶ On a basic level it is just a network of networks.

The Internet

- ▶ When going to a website how does your computer know where to go?
 - ▶ Type in the Uniform Resource Locator (URL) bar,
e.g. google.com, utexas.edu...
- ▶ Your computer needs to translate that URL into something the network knows how to use.
 - ▶ Internet Protocol (IP) address.
 - ▶ utexas.edu — > 23.185.0.4

IP address

- ▶ Is a 32 bit number represented by a grouping of 4 octets.
 - ▶ 192.168.0.1
 - ▶ In hex: c0 a8 00 01

DNS¹ resolution

- ▶ How do domain names get resolved to IP addresses?
- ▶ i.e. How does my browser know how to take me to wikipedia.org
 - ▶ A query (IPv4)
 - ▶ AAAA query (IPv6)
- ▶ How to get IP address of wikipedia.org
 - ▶ `nslookup wikipedia.org`

¹Domain Name System

nslookup output

```
> nslookup wikipedia.org
```

```
Server:      128.83.185.40
```

```
Address:     128.83.185.40#53
```

```
Non-authoritative answer:
```

```
Name:   wikipedia.org
```

```
Address: 208.80.153.224
```

```
Name:   wikipedia.org
```

```
Address: 2620:0:860:ed1a::1
```

Server: is the DNS server your computer is querying.

Address: is the DNS server and the port.

Why port 53?²

²Click

Your Local DNS server

For linux /etc/resolve.conf

```
> cat /etc/resolv.conf
```

```
# Generated by resolvconf
domain public.utexas.edu
nameserver 128.83.185.40
nameserver 128.83.185.41
```

Your Local DNS server

- ▶ How does your local DNS server know where to go?
- ▶ DNS is a distributed hierarchical database
 - ▶ Root DNS server
 - ▶ 13 labeled A-M
 - ▶ Top Level Domain (TLD) server
 - ▶ com, org, edu
 - ▶ Authoritative DNS server
 - ▶ amazon.com, pbs.org, utexas.edu

Example:

Let's look at wikipedia.org while recording a TCP dump which we will open with wireshark.

Tools:

- ▶ whois
 - ▶ Additional information about the IP address from the whois database
- ▶ dig
 - ▶ Similar to nslookup
- ▶ traceroute
 - ▶ Tries to find all the intermediary machines to a host
 - ▶ use with -T or -I and run as sudo
- ▶ nmap
 - ▶ -A Aggressive
 - ▶ -O OS detection

Tools:

- ▶ Zmap
 - ▶ Is a network tool for scanning the entire Internet (or large samples).
 - ▶ `wget http://64.106.81.7/blacklist.txt`
 - ▶ `sudo zmap --bandwidth=1M --target-port=80 --output-file=results.csv -b blacklist.txt`
- ▶ If we were to zmap ece.utexas.edu how would we go about it?
 - ▶ Find out the range of IPs assigned to `http://www.ece.utexas.edu/`
 - ▶ `dig` or `nslookup` to get IP
 - ▶ Whois acquired IP to get the range of IP's in the network

RFC

- ▶ Request for Comments.
- ▶ Internet Engineering Task Force (IETF).
- ▶ Internet Research Task Force (IRTF).
- ▶ Internet Architecture Board (IAB).
- ▶ Independent authors.
- ▶ Engineers and computer scientists.

CIDR

- ▶ Classless Inter-Domain Routing.
- ▶ Notation for talking about ranges of IP address.
- ▶ Rare to see 192.168.0.0 - 192.168.0.255.
- ▶ Instead you would see 192.168.0.0/24.
- ▶ Equivalent to matching a netmask of 255.255.255.0.

CIDR

- ▶ Value after the / is called the prefix length.
- ▶ Number of address is
 - ▶ $2^{\text{addressLength} - \text{prefixLength}}$
- ▶ Prefix length is the number of leading 1's in the subnet netmask.

CIDR

- ▶ $0.0.0.0/8 = \text{Class A}$
- ▶ $0.0.0.0/16 = \text{Class B}$
- ▶ $0.0.0.0/24 = \text{Class C}$

CIDR

- ▶ /29
 - ▶ $32 - 29 = 3$
 - ▶ $2^3 = 8$
- ▶ /32
 - ▶ size of 1
- ▶ /9
 - ▶ $32 - 9 = 23$
 - ▶ $2^{23} = 8388608$

Packets

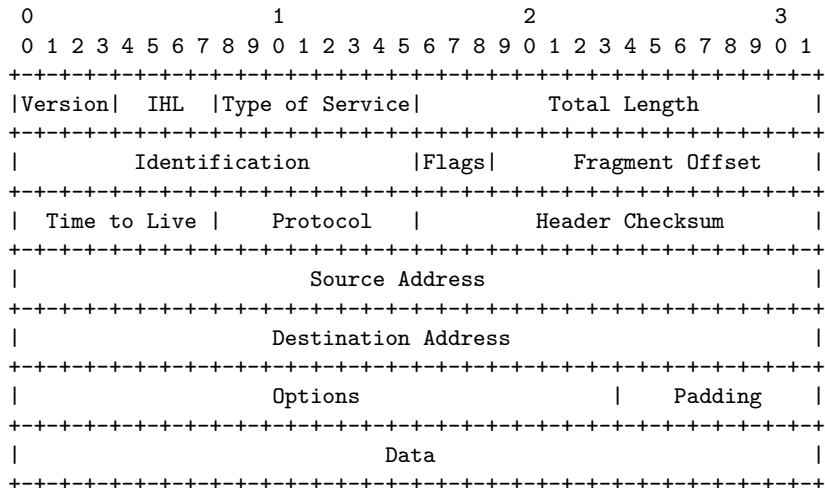

Ethernet

Preamble	Destination MAC address	Source MAC address	Type	User Data	Frame Check Sequence (FCS)
8	6	6	2	46 - 1500	4

Preamble: Ethernet hardware filters this field so it won't be visible in Wireshark

FCS: Often missing from Wireshark

IPv4

IHL: Internet Header Length, number of 32-bit words.

TCP

[illegible]

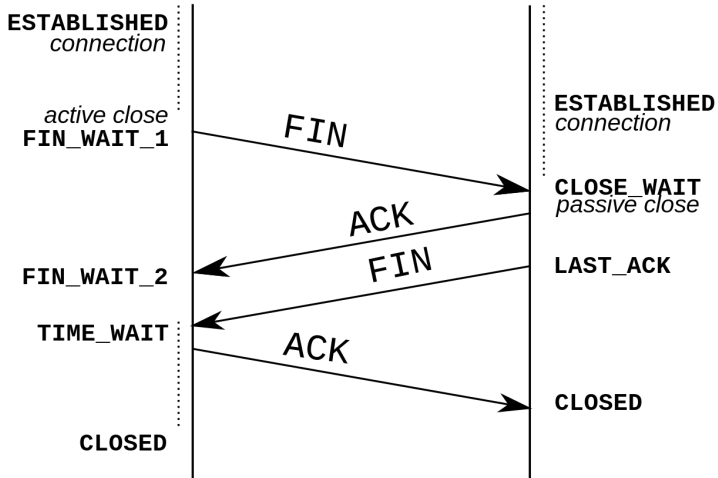

Three way hand shake

- ▶ Client Sends SYN packet.
 - ▶ Client chooses a random sequence number.
- ▶ Server Sends SYN/ACK packet.
 - ▶ The acknowledgment number is set to one more than the received sequence number.
 - ▶ Server chooses a random sequence number.
- ▶ Client sends ACK packet.
 - ▶ The sequence number is set to the received acknowledgement value.
 - ▶ The acknowledgement number is set to one more than the received sequence number.

Terminate connection

Initiator

Receiver

But what if we don't finish the handshake?

We end up with a half open connection.

- ▶ What is a half open connection?
- ▶ Two ways to store half open connections.
 - ▶ TCP backlog.
 - ▶ size: `sysctl net.ipv4.tcp_max_syn_backlog`
 - ▶ SYN cookies.
 - ▶ Stateless, require no system resources.
 - ▶ Limited in entropy.
 - ▶ Stored in the sequence number.

SYN cookies

Return a special sequence number where they encode the following:

- ▶ Top 5 bits: $t \bmod 32$, where t is a 32-bit time counter that increases every 64 seconds;
- ▶ Next 3 bits: an encoding of an MSS selected by the server in response to the client's MSS;
- ▶ Bottom 24 bits: a server-selected secret function of the client IP address and port number, the server IP address and port number, and t .

Why SYN cookies

- ▶ Pro
 - ▶ Defend against DOS/DDOS attacks
 - ▶ Stays up when SYN cache is exhausted
- ▶ Con
 - ▶ Loss of entropy
 - ▶ Attacks that require the attacker to know the initial sequence number are easier to execute with a decrease of entropy.
 - ▶ Attacks: blind RST, blind injection, blind connection.

Sequence and Acknowledgment number

- ▶ Reliable transmission of data.
 - ▶ If a packet is not received, the protocol retransmits the data.
- ▶ Other uses of sequence numbers?
 - ▶ Out of order packets.

Windows

- ▶ Each endpoint has a receive buffer size.
- ▶ There are many ways to send data. . .
 - ▶ However sending one packet at a time can be wasteful.
- ▶ Windows are solution.
 - ▶ The receiver has a window of packets for which it will accept sequence numbers.
 - ▶ The sender has a window as well..
- ▶ Two common methods to implementing windows.
 - ▶ Go-Back-N ³
 - ▶ Selective Repeat Protocol(SRP) ⁴

³Click the link

⁴Click the link

OSI stack

- ▶ Traditionally had 7 layers:
 - ▶ Application layer, presentation layer, session layer, transport layer, network layer, data link layer, and physical layer.
 - ▶ Antiquated as the OSI model was invented during the Internet's infancy.
- ▶ More common model is 5 layered.
 - ▶ Application
 - ▶ Transport
 - ▶ Network
 - ▶ Link
 - ▶ Physical

OSI stack

Scapy

- ▶ Must use as sudo if you want to send packets.
- ▶ Can import the scapy library into python.
- ▶ Can use scapy to make send and receive packets.
- ▶ `IP()`
- ▶ `IP()/TCP()`
- ▶ `IP(dst="slashdot.org")/TCP()`
- ▶ `IP(dst="slashdot.org")/TCP(dport=80)`
- ▶ `IP(dst="slashdot.org")/TCP(dport=[80,443])`
- ▶ `z = IP(dst="slashdot.org")/TCP(dport=80)`
- ▶ `r = sr(z)`

Scapy

- ▶ `p = IP(dst="slashdot.org")/TCP(dport=80)`
- ▶ `p[1] = TCP` section
- ▶ In python `import scapy.all` give you everything but you need to use `scapy.all.SCAPYFUNC`
- ▶ `from scapy.all import IP, TCP, sr`
- ▶ use `\` to compose e.g. `a = IP(dst="slashdot.org")/TCP(dport=80)/"GET / HTTP/1.0\r\n\r\n"`

Cryptography basics

- ▶ Symmetric encryption.
 - ▶ AES, twofish, serpent.
 - ▶ Public key exchange.
 - ▶ Diffie–Hellman.
- ▶ Asymmetric encryption.
 - ▶ RSA, named after the inventors Rivest, Shamir and Adleman.
- ▶ Hashing.
 - ▶ Why do we hash?
 - ▶ H-MAC.
 - ▶ Signatures.

Symmetric encryption

- ▶ Encrypt and decrypt with same key.
- ▶ Relatively fast.
- ▶ How to get both parties the key?
 - ▶ Key exchange
- ▶ AES
 - ▶ Block cypher

AES

1. KeyExpansion—round keys are derived from the cipher key using Rijndael's key schedule. AES requires a separate 128-bit round key block for each round plus one more.
2. Initial round key addition: AddRoundKey—each byte of the state is combined with a block of the round key using bitwise xor.

AES

3. 9, 11 or 13 rounds: (key size dependant)
 - 3.1 SubBytes—a non-linear substitution step where each byte is replaced with another according to a lookup table.
 - 3.2 ShiftRows—a transposition step where the last three rows of the state are shifted cyclically a certain number of steps.
 - 3.3 MixColumns—a linear mixing operation which operates on the columns of the state, combining the four bytes in each column.
 - 3.4 AddRoundKey
4. Final round (making 10, 12 or 14 rounds in total):
 - 4.1 SubBytes
 - 4.2 ShiftRows
 - 4.3 AddRoundKey

Key exchange

- ▶ Diffie-Hellman key exchange.
 - ▶ Allows two parties that have no prior knowledge of each other to establish a shared secret key over an insecure channel.
 - ▶ Uses a multiplicative group of integers modulo a prime p .
- ▶ No authentication, possible MITM.
- ▶ Provides forward secrecy.
 - ▶ Protects past sessions against future compromises of secret keys.

Diffie-Hellman

1. Alice and Bob publicly agree to use a modulus $p = 6700417$ and base $g = 4095$ (which is a primitive root modulo p).
2. Alice chooses a secret integer $a = 90$, then sends Bob $A = g^a(\text{mod})p$. $A = 4095^{90}(\text{mod})6700417 = 4081248$
3. Bob chooses a secret integer $b = 50$, then sends Alice $B = g^b(\text{mod})p$. $B = 4095^{50}(\text{mod})6700417 = 4251305$
4. Alice computes $s = B^a(\text{mod})p$
 $s = 4251305^{90}(\text{mod})p = 608102$
5. Bob computes $s = A^b(\text{mod})p$ $s = 4081248^{50}(\text{mod})p = 608102$
6. Alice and Bob now share a secret (the number 608102).

Diffie-Hellman

There is another form of DH key exchange known as elliptic curve Diffie-Hellman ECDH. ECDH uses a multiplicative group of points on an elliptic curve.

Here is a link to a great article that describes in detail how elliptic curves work.

Same idea as regular DH in the sense that you are creating a shared secret on an insecure channel.

Asymmetric encryption

- ▶ Public and private key pairs.
- ▶ Slower than symmetric systems.
- ▶ RSA
 - ▶ Relies on the difficulty of factoring large numbers.
- ▶ How to share keys?
 - ▶ Public Key Infrastructure (PKI)

RSA

- ▶ Pick prime numbers, p and q .
- ▶ Calculate $n = pq$
- ▶ Calculate the totient of n $\phi(n) = lcm((p-1), (q-1))$
- ▶ Choose an integer e that is co-prime to $\phi(n)$
- ▶ Calculate d such that $de \equiv 1 \pmod{\phi(n)}$
- ▶ (d, n) is your private key
- ▶ (e, n) is your public key

RSA

- ▶ To calculate cipher text:
 - ▶ $c = m^e \bmod(n)$
- ▶ To decrypt cipher text:
 - ▶ $m = c^d \bmod(n)$

Message Authentication Codes (MAC)

- ▶ MAC are used to detect a messages integrity.
 - ▶ Verify the message is from the correct person, and has not been changed.
- ▶ HMAC
 - ▶ $h(K \oplus a || h(K \oplus b || m))$

$$h(K \oplus a || h(K \oplus b || m))$$

- ▶ K is a key padded with 0's
- ▶ h is a cryptographic hash function
- ▶ m is the message to be authenticated
- ▶ || denotes concatenation
- ▶ \oplus denotes bitwise exclusive or (XOR)
- ▶ a is the block-sized outer padding, consisting of repeated bytes valued 0x5c
- ▶ b is the block-sized inner padding, consisting of repeated bytes valued 0x36

Today's Topics

- ▶ RSA, AES recap.
- ▶ AES in detail.
- ▶ Hashing.
- ▶ TLS, VPN, TOR.
- ▶ Side channels.

Early Cryptography

- ▶ Rotation cipher.
 - ▶ ABCDEFGHIJKLMNOPQRSTUVWXYZ
 - ▶ UVWXYZABCDEFGHIJKLMNQRST
- ▶ Substitution cipher.
 - ▶ ABCDEFGHIJKLMNOPQRSTUVWXYZ
 - ▶ OMWPDCKYUVNHQZGBJAXFLRETSI

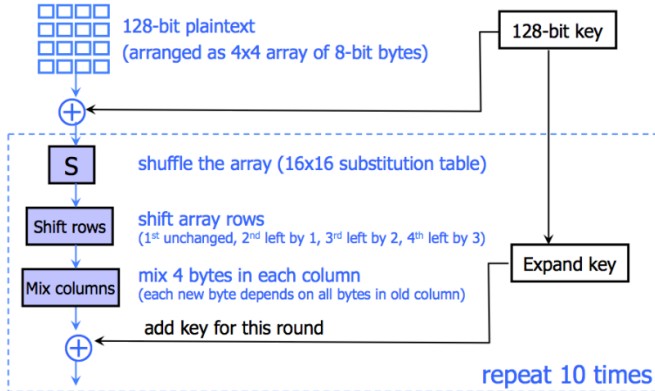

Early Cryptography

- ▶ Poly-alphabetic cipher
 - ▶ Different substitution for odd and even letters.
 - ▶ ABCDEFGHIJKLMNOPQRSTUVWXYZ
 - ▶ UVWXYZABCDEFGHIJKLMNQRST
 - ▶ XGQBEDZVICTJMOPWSFLNYRHUKA

Perfectly secure cipher

- ▶ One time pad.
- ▶ XOR a predefined set of bits with a message to encrypt.
- ▶ Easy to compute.
- ▶ Hard to share keys.
- ▶ Can not reuse the pad

Hashing

- ▶ A one way function
- ▶ Takes a string of arbitrary length and computes a fixed length output.
- ▶ Hashing algorithms should have 3 main properties.
 - ▶ Pre-image resistance
 - ▶ Second pre-image resistance
 - ▶ Collision resistant

Hashing

- ▶ Pre-image resistance
 - ▶ Given a hash value h it should be difficult to find any message m such that $h = \text{hash}(m)$
- ▶ Second pre-image resistance
 - ▶ Given an input m_1 , it should be difficult to find a different input m_2 such that $\text{hash}(m_1) = \text{hash}(m_2)$
- ▶ Collision resistant
 - ▶ It should be difficult to find two different messages m_1 and m_2 such that $\text{hash}(m_1) = \text{hash}(m_2)$

Hashing

One iteration of SHA2 is below, total 64 per chunk(512bit).

The blue components perform the following operations:

$$\text{Ch}(E, F, G) = (E \wedge F) \oplus (\neg E \wedge G)$$

$$\text{Ma}(A, B, C) = (A \wedge B) \oplus (A \wedge C) \oplus (B \wedge C)$$

$$\Sigma_0(A) = (A \ggg 2) \oplus (A \ggg 13) \oplus (A \ggg 22)$$

$$\Sigma_1(E) = (E \ggg 6) \oplus (E \ggg 11) \oplus (E \ggg 25)$$

The bitwise rotation uses different constants for SHA-512. The given numbers are for SHA-256.

The red \boxplus is addition modulo 2^{32} for SHA-256, or 2^{64} for SHA-512.

Applying cryptography to networking

- ▶ What issues does encryption solve?
- ▶ What issues still exist?
- ▶ How do you know you are talking to the correct server?
- ▶ How can we be sure that the communication with the server is private?

Verification

- ▶ How to verify a server is who they say they are?
 - ▶ A trusted third party.
 - ▶ IdenTrust, Comodo, DigiCert
 - ▶ Certificate Authorities(CA).
 - ▶ X.509 protocol.
 - ▶ Check out a certificate in Firefox.

Certificate

Contains the following information and more.

- ▶ Version.
- ▶ Serial # , a CA issued.
- ▶ Signature, specifies the algorithm used to sign the cert.
- ▶ Issuer Name, the CA who issued the cert.
- ▶ Validity period
- ▶ Subject name
- ▶ Subject public key

Certificate

- ▶ In addition to the information the certificate contains, a hash of the information that has been encrypted with a trusted CA's private key.
- ▶ The user can then calculate the same hash, and decrypt the provided encrypted hash to make sure they match.

Transport Layer Security ⁵

- ▶ Probably the Internet's most important security protocol
- ▶ Designed over 20 years ago by Netscape for Web transactions
- ▶ Back then, called Secure Sockets Layer
- ▶ But used for just about everything you can think of
 - ▶ HTTP
 - ▶ SSL-VPNs
 - ▶ E-mail
 - ▶ Voice/video
 - ▶ IoT

⁵Heavily lifted from Eric Rescorla

TLS attacks

NETSCAPE

SSL 2.0 (1995) → SSL 3.0 (1996)

I E T F

TLS 1.0 (1999) → TLS 1.1 (2006) → TLS 1.2 (2008)

*Slide from van der Merwe and Paterson

TLS Structure

- ▶ Handshake protocol
 - ▶ Establish shared keys (typically using public key cryptography).
 - ▶ Negotiate algorithms, modes, parameters.
 - ▶ Authenticate one or both sides.
- ▶ Record protocol
 - ▶ Carry individual messages.
 - ▶ Protected under symmetric keys.

TLS 1.3

	Client		Server

	[Application Data] <-----		[Application Data]

mitmproxy

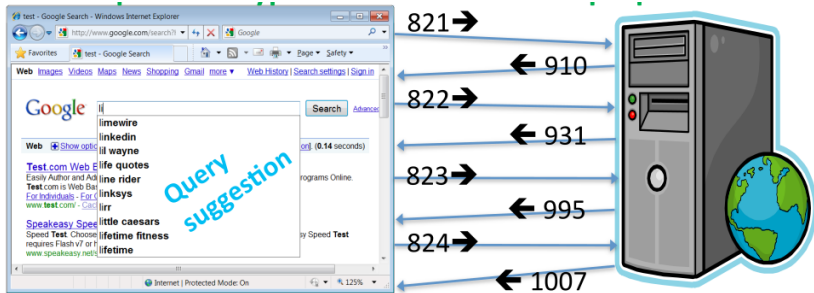

- ▶ Off the shelf tool to preform a man in the middle attack
- ▶ Can intercept your own https traffic.
- ▶ MUST download certificate. - mitmproxy generages unique certs for every install.
- ▶ Configure network settings of your browser to use a manual proxy - 127.0.0.1 - port 8080 - check use this proxy server for all protocols

Side channel attacks ⁶

- ▶ Surprisingly detailed user information is being leaked out from several high-profile web applications
 - ▶ personal health data, family income, investment details, search queries
- ▶ The root causes are some fundamental characteristics in today's web apps
 - ▶ stateful communication, low entropy input and significant traffic distinctions.

⁶Side-channel-leaks in Web Applications: A Reality today, A Challenge Tomorrow

Side channel attacks

Side channel attacks

- ▶ Similar methods can deanonymize other types of traffic as well.
 - ▶ Investment information.
 - ▶ Each price history curve is a GIF image from MarketWatch
 - ▶ Medical information.
 - ▶ Similar to search example
 - ▶ Tax filing web sites.

Anonymity

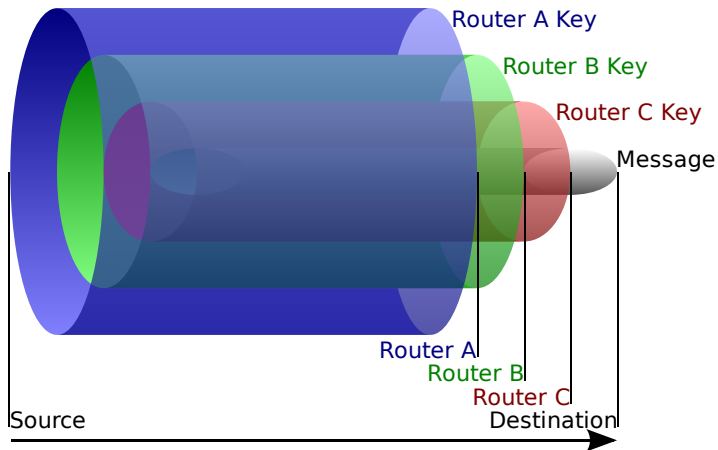

What tools do people use to try to be anonymous?

- ▶ VPN
 - ▶ Uses?
 - ▶ Trust model.
 - ▶ DNS Leak.
- ▶ TOR
 - ▶ Onion routing.

What is TOR

- ▶ Online anonymity
 1. Software
 2. Network
 3. Protocol
- ▶ Open source, freely available
- ▶ Community of researchers, developers, users, and relay operators
- ▶ Funding from US DoD, Electronic Frontier Foundation, Voice of America, Google, NLnet, Human Rights Watch

Onion Routing

TOR

How Tor Works: 1

Alice

Step 1: Alice's Tor client obtains a list of Tor nodes from a directory server.

Dave

Jane

Bob

How Tor Works: 2

Alice

Step 2: Alice's Tor client picks a random path to destination server. **Green links** are encrypted, **red links** are in the clear.

Dave

Jane

Bob

How Tor Works: 3

Alice

Step 3: If at a later time, the user visits another site, Alice's tor client selects a second random path. Again, **green links** are encrypted, **red links** are in the clear.

Dave

Jane

Bob

TOR

Attackers can block users from connecting to the Tor network:

- ▶ By blocking the directory authorities
- ▶ By blocking all the relay IP addresses in the directory
- ▶ By filtering based on Tor's network fingerprint
- ▶ By preventing users from finding the Tor software

TOR

- ▶ For places that block by IP.
- ▶ Request a bridge.
- ▶ A relay not listed in the main directory.
 - ▶ Some countries blacklist all IPs in the main directory.

TOR

- ▶ For places that block by traffic shape:
 - ▶ Pluggable transports are the solution.
 - ▶ Shape traffic so that it looks like something else.
 - ▶ Skype, meek, obs4. . .

Bro/zeek

- ▶ Bro is being re-named as zeek.
- ▶ Bro is a passive, open-source network traffic analyzer.
- ▶ It is primarily a security monitor that inspects all traffic on a link in depth for signs of suspicious activity.
- ▶ Can be used as an IDS
- ▶ Originally developed by Vern Paxson to detect network intruders in real time.

- ▶ Captures packets.
- ▶ Runs through an event engine which accepts or rejects.
- ▶ Forwards accepted events to policy script interpreter.

Zeek

- ▶ Events handled by policy scripts.
- ▶ Scripts are written in zeek's scripting language.

Zeek

```
#Create a new event handler "file_new"
#When Bro finds a file being transferred
#(via any protocol it knows about),
# write a basic message to stdout and then
#tell Bro to save the file to disk.
event file_new( f: fa_file)
{
local fuid = f$id;
local fsource = f$source;
local ftype = f$mime_type;
local fname = fmt(" extract-%s-%s", fsource, fuid);
print fmt("*** Found %s in %s. Saved as %s. File ID is %s", ftype,
fsource, fname, fuid);
Files:: add_analyzer(f, Files:: ANALYZER_EXTRACT,
[$ extract_filename = fname]);
}
```

Zeek

- ▶ Can be run on the command line:
- ▶ `sudo bro -i enp0s3`
- ▶ Where `enp0s3` is your networking interface.
- ▶ Creates log files in the directory it is run from.

Snort

- ▶ IDS
- ▶ Intrusion Prevention System (IPS)
- ▶ Real time packet analysis, and packet logging
- ▶ Can also be used to detect probes or attacks,
 - ▶ Such as, operating system fingerprinting attempts, semantic URL attacks, buffer overflows, server message block probes, and stealth port scans

HTTP protocol

HyperText Transfer Protocol

- ▶ A request response protocol in the client server computing model.
- ▶ GET is the main request (eg. retrieve the contents of a webpage).
- ▶ For a list of the other requests see the RFC

HTTP protocol

A response has the following structure:

- ▶ a status line which includes the status code and reason message.
- ▶ response header fields (e.g., Content-Type: text/html)
- ▶ an empty line
- ▶ an optional message body
